### Investment objective

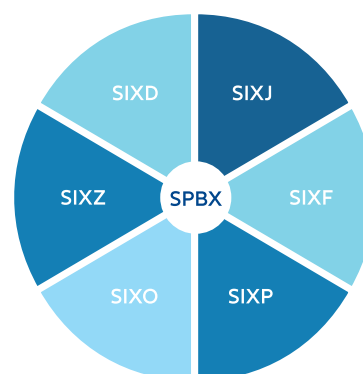

The fund seeks to provide capital appreciation with downside risk mitigation.

### How does SPBX work?

SPBX holds an equally weighted allocation of the full lineup of AllianzIM 6 Month Buffer10 ETFs. By laddering the underlying ETFs, SPBX offers diversified exposure to the S&P 500® with built-in risk mitigation. Each month, one of the underlying ETFs resets back to the full protection level of its 10% buffer for the new 6-month outcome period, with an adjusted cap based on market volatility.

### Underlying holdings allocation

The underlying buffered outcome ETFs investment strategies are different from more typical investment products, and the funds may be unsuitable for some investors. It is important that investors understand the investment strategy before making an investment.

Underlying buffers and caps will be reduced after taking into account management fees and other fund fees and expenses.

Unlike the underlying ETFs, the fund itself does not pursue a buffered strategy. The buffer is only provided by the underlying ETFs, and the fund itself does not provide any stated buffer against losses. The laddered approach of the fund may cause the fund to not receive the full intended benefit of any individual underlying ETF's buffer. The fund could have limited upside potential, and its return may be limited to the caps of the underlying ETFs.

Shareholders of the fund will experience investment returns that are different than the investment returns sought by the underlying ETFs.

**Investing involves risks. Loss of principal is possible. Investors may lose their entire investment, regardless of when they purchase shares, and even if they hold shares for an entire outcome period.**

Investors should consider the investment objectives, risks, charges, and expenses carefully before investing.
